

Prevent injury from cattle sliding down or pulling back out of the bales! The innovative **SureHold™ System** provides an easy **retro-fit solution** to ensure your crush securely holds your cattle and prevents them from breaking free.

The unique "Sure Hold™" design prevents cattle from pulling their heads free from the crush

Benefits

- Reduces injury to both animals & handlers
- Easy to install and can be retro-fitted
- Cost effective – no need to replace existing crush

Applications:

- Cattle Crushes
- Knocking boxes

The **RPS SureHold™ System** was developed in response to industry feedback indicating that the traditional crushes manufactured from straight tubing are unable to properly contain cattle whose neck dimensions are as big, if not bigger than their head.

The cattle were placing themselves and their handlers at risk of injury by 'pulling free' from the constraints of the crush that was originally designed for cattle with thinner necks.

The **SureHold™ System** was specifically designed to address this issue and *can be retro-fitted to the existing crush*. This eliminates the need for a costly replacement and ensures that the crush remains *functional for years to come*.

Technical Specifications

Total Dimensions	
Thickness:	25 - 40mm variable
Width:	65mm
Length:	700mm
